

AquaSearch ORGANIC

A growing number of markets worldwide are requesting certified organic products, including the pan size rainbow trout. For this niche production, AquaSearch ova is offering AquaSearch ORGANIC eggs produced from natural mixed sex brood stock populations.

Because of the male element, slightly higher growth rate during the initial phase of the organic fish lifecycle can be expected, and equally reduced average growth rate towards the end of the production period when the male maturation process is initiated.

The production of mixed sex trout requires special attention to the potential maturation of the one to two year old males.

AquaSearch ORGANIC is characterized by:

- High hatchability
- Low feed conversion rate
- Licensed specific disease freeness
- Including freeness from IPN
- High growth rate
- Elongated body shape
